DETAILED ACTION

Claim Objections

1. Claim 3 is objected to because of the following informalities: claim 3 is repeated from claim 2. Appropriate correction is required.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baldwin (6,025,853) in view of Brend et al (5,459,864).

Baldwin teaches a graphics processor (2E) comprising a plurality of parallelized graphics computational units (col. 64, lines 16-21, 25-29 and 38-40), such as, rasterizer, scissor, stipple, alpha test, fog, texture, stencil test, depth test, local and frame buffer controllers. However, Baldwin fails to explicitly teach or suggest one or more task allocation units programmed to bypass defective ones of said subunits within said groups, and distribute incoming tasks only among operative ones of said subunits. It is old and well known and well used in the art to dynamically load balanced among multiple processors include skip or bypass defective unit(s). Furthermore, Brent teaches a load balancing, error recovery and reconfiguration control in a data movement subsystem with cooperating plural queue processors (Fig. 2, abstract, col. 2, lines 39-45, col. 5, lines 49-52 and col. 6, lines 11-18). It would have been obvious to

one of ordinary skill in the art at the time the present invention was made to combine the teachings of Brend into the system of Baldwin in order to automatic load balancing among plural processors, automatic recovery from any failing processor, and automatic reconfiguration for the subsystem containing the processors without intervention from the operating system as taught by Brend (col. 1, lines 18-24). Therefore, at least claims 1-7 would have been obvious.
